ABSTRACT

Tumor or neoplasm can be meant as a abnormal and uncontrol growth of the transformation tissue or the change of one or main location of the body. This degenerative disease is one of the diseases in the animal pet especially dog and cat. Generally this tumor diseases can be treated with surgery and usually will relapse after six months. From our previous research had succeeded to prove by using activity in vitro antiproliferative from extract plant (nusa indah, blistrum and temu putih) combined with recombinant interferon dog (rCaIFN). The above phenomenon indicate a new hope to make a therapy for tumor disease, especially for dog and cat and may be in the future can be used for human. In this research we used 21 female rabbits and divided into 7 treatment groups, consisted of 3 rabbits ie : group A. negative control; B. surgery, preventive and curative curcumine; C. positive control; D. positive control and surgery; E. surgery and preventive zedoaria capsul; F. surgery , preventive and curative zedoaria capsule and G. surgery and curative zedoaria capsule . Induction with carcinogen (MNU) treated every weeks during 3 weeks. Surgery is executed in the 5 weeks and giving capsule zedoaria is executed every day for 4 weeks (preventive or curative) and 8 weeks (preventive and curative). Result of the research indicated that mammae tumor has been made successfully by MNU (n-methyl-n-nitrosuria) induction to rabbit and capsule zedoaria and it has been treated by doing surgery therapy (mastectomy and ovariohysterectomy). Also decombination of zedoaria capsule. The result of the research indicated hindrance of tumorigenesis to the group which is given by zedoaria capsule. From the clinical picture shows that zedoaria capsule does not give negative effect to clinical picture (temperature, respiratory frequency and heart rate)/ still normal to all the groups. Tumor induction with (MNU) at mammary gland will occur allergic reaction inflammatory which is the beginning of tumor mechanism which is marked by total leucosit, neutrophil, eosinophil, and basophil increase. Tumor therapy with surgery (masektomi and ovariohisterektomi) and the combination with rimpang Temu Putih capsule can decrease the number of leucosit, neutrophil and lymphocyte but only a little affect monosit number, although statistically it does not show real difference.

Keywords : *Curcuma zedoaria*, mastektomi, n-metil-n-nitrosuria, ovariohisterektomi, tumor mammae.

ABSTRAK

Tumor atau neoplasma dapat diartikan sebagai suatu pertumbuhan abnormal dan tidak terkontrol jaringan yang mengalami transformasi atau perubahan pada satu atau lebih tempat utama dalam tubuh inang. Penyakit degeneratif ini merupakan salah satu penyakit pada hewan piara, khususnya anjing dan kucing yang sering ditemui di lapangan. Pada umumnya penyakit tumor ini diobati dengan cara operasi dan biasanya akan muncul kembali setelah lebih dari 6 bulan. Penelitian terdahulu (Hibah Bersaing XI tahun 2003–2004) telah berhasil menguji secara *in vitro* aktivitas antiproliferasi ekstrak tanaman (nusa indah, blistrum dan temu putih) yang dikombinasikan dengan rekombinan interferon anjing (rCaIFN). Fenomena di atas mengindikasikan suatu harapan baru bagi penanganan dan pengobatan penyakit tumor, khususnya pada hewan anjing dan kucing yang juga dapat diterapkan nantinya pada manusia. Dalam penelitian ini digunakan 21 ekor kelinci betina yang dibagi ke dalam 7 kelompok perlakuan yang masing-masing

terdiri atas 3 ekor kelinci, yaitu A. kelompok kontrol negatif, B. operasi, preventif dan kuratif curcumine, C. kontrol positif, D. Kontrol positif dan Operasi, E. Operasi, preventif kapsul rimpang temu putih, F. Operasi, Preventif dan kuratif kapsul rimpang temu putih, dan G. Operasi dan kuratif kapsul rimpang temu putih. Induksi dengan karsinogen (MNU) dilakukan setiap minggu selama 3 minggu. Operasi dilakukan pada minggu
